AMENDMENT OF THE CLAIMS TO INVENTION:

Please cancel Claims 1-~~669~~<sup>668</sup> and add new Claims ~~670-680~~<sup>669-679</sup> as follows:

<sup>669</sup>  
--~~670~~. A system for producing high-resolution 3-D images of 3-D object surfaces of arbitrary surface geometry moving relative to said system, said system comprises:  
an object profiling subsystem for profiling an 3-D object surface of arbitrary surface geometry moving past said system, and producing a series of linear 3-D surface profile maps of said moving 3-D object surface as said 3-D object surface moves past said system,  
wherein each said linear 3-D surface profile map comprises a set of 3-D coordinates specifying the location of sampled points along said moving 3-D object surface;  
a linear imaging subsystem for producing a series of linear high-resolution 2-D images of said moving 3-D object surface as said 3-D object surface moves past said system,  
wherein each said linear high-resolution 3-D image comprises a set of pixel intensity values, and each said pixel intensity value being assigned a set of two-dimensional coordinates specifying the location of the pixel in said linear high-resolution 2-D image; and  
an image processing computer for constructing high-resolution 3-D images of said 3-D object surface using said linear 3-D surface profile maps and said high-resolution 2-D linear images of said moving object surface.--

<sup>670</sup>  
--~~671~~. The system of claim ~~670~~<sup>669</sup>, wherein said image processing computer further comprises:  
(i) means for producing a 3-D surface geometry model of said moving 3-D object surface using said linear 3-D surface profile maps,  
(ii) means for mathematically projecting pixel rays from each pixel in each said captured linear high-resolution 2-D image,

10068462.020702  
R1.26

(iii) means for computing the  $x$ ,  $y$ ,  $z$  coordinates associated with the points of intersection between these pixel rays and said 3-D surface-geometry model, and

(iv) means for generating a linear high-resolution 3-D image of said moving 3-D object surface based on said computed points of intersection,

whereby each pixel in said high-resolution linear 3-D image comprises an intensity value  $I(x, y, z)$  and a set of  $x, y, z$  coordinate values specifying the location of the sampled point of said moving 3-D object surface; and

(v) assembling, in an image buffer, a set of consecutively computed linear high-resolution 3-D images so as to construct an area-type high-resolution 3-D image of said moving 3-D object surface.--

<sup>671</sup>  
~~672~~. The system of claim <sup>670</sup>~~671~~, wherein said image processing computer further comprises:

(vi) at the image processing computer, mapping the intensity value  $I(x', y', z')$  of each pixel in said computed area-type 3-D image onto the  $x', y', z'$  coordinates of points on a uniformly-spaced grid surface positioned along the optical axis of said linear imaging subsystem so as to model a 2-D planar substrate on which graphical forms of intelligence on said 3-D object surface might have been originally rendered; and

(vii) using an intensity weighing function based on the  $x', y', z'$  coordinate values of each pixel in said area-type high-resolution 3-D image, to produce an area-type high-resolution 2-D image of said 2-D planar substrate surface bearing said forms of graphical intelligence.--

<sup>672</sup>  
~~673~~. The system of claim <sup>671</sup>~~672~~, which further comprises:

(viii) at the image processing computer, using said OCR algorithm to perform automated recognition of graphical forms of intelligence that might be possibly contained in said area-type high-resolution 2-D image of said 2-D planar substrate surface so as to recognize said graphical forms of intelligence and generate symbolic knowledge structures representative thereof.--

<sup>673</sup>  
~~674~~. A method of producing high-resolution 3-D images of 3-D object surfaces of arbitrary surface geometry moving relative to said system, said method comprising the steps of:

(d) at the image processing computer, mapping the intensity value  $I(x', y', z')$  of each pixel in said computed area-type 3-D image onto the  $x', y', z'$  coordinates of points on a uniformly-spaced grid surface positioned along to the optical axis of said linear imaging subsystem so as to model a 2-D planar substrate on which graphical forms of intelligence on said 3-D object surface might have been originally rendered; and

(e) using an intensity weighing function based on the  $x', y', z'$  coordinate values of each pixel in said area-type high-resolution 3-D image, to produce an area-type high-resolution 2-D image of said 2-D planar substrate surface bearing said forms of graphical intelligence.--

<sup>676</sup>  
--<sup>677</sup>. The method of claim <sup>675</sup>~~676~~, which further comprises:

(f) at the image processing computer, using said OCR algorithm to perform automated recognition of graphical forms of intelligence that might be possibly contained in said area-type high-resolution 2-D image of said 2-D planar substrate surface so as to recognize said graphical forms of intelligence and generate symbolic knowledge structures representative thereof.--

<sup>677</sup>  
--<sup>678</sup>. A method of recognizing graphical intelligence recorded on planar substrates that have been physically distorted as a result of either (i) application of the graphical intelligence to an arbitrary 3-D object surface, or (ii) deformation of a 3-D object on which the graphical intelligence has been rendered.--

<sup>678</sup>  
--<sup>679</sup>. The method of claim <sup>677</sup>~~678~~, which is capable of "undistorting" any distortions imparted to the graphical intelligence while being carried by the arbitrary 3-D object surface due to, for example, non-planar surface characteristics.--

<sup>679</sup>  
--<sup>680</sup>. A method of recognizing graphical intelligence, originally formatted for application onto planar surfaces, but applied to non-planar surfaces or otherwise to substrates having surface characteristics which differ from the surface characteristics for which the graphical intelligence was originally designed without spatial distortion.--
